Sports-Related Concussions: A Guide to Diagnosis, Management and Return to Play

Kristina Nivus, D.O.
Unity Health Care
The Wright Center for Graduate Medical Education
Objectives

- Define concussion
- Identify the pathophysiology of concussion
- Recognize concussive symptoms
- Review epidemiology
- Sideline evaluation
- Management of concussion
- Return to play guidelines
- Return to learning guidelines
What Is A Concussion?

• Traumatically induced transient disturbance of brain function
• Clinical syndrome of biomechanically induced alteration of brain function, typically affecting memory and orientation
• Zurich Guidelines: “complex pathophysiological process affecting the brain, induced by traumatic biomechanical forces”
Major Features

• Caused by direct blow to head or a blow that results in impulsive force transmitted to head
• Rapid onset of short-lived impairment of neurologic function
• Acute clinical symptoms reflect a functional disturbance rather than a structural injury
• Results in a graded set of clinical symptoms and resolution follows a sequential course
• May or may not involve loss of consciousness
Pathophysiology

• Acceleration-deceleration, rotational forces
• Animal models have been used to describe possible pathophysiologic mechanism
  – Unclear if it can be applied to sport-related concussion
Risk Factors & Modifiers

- Previous history of concussion
- Greater number or severity of initial symptoms
- Female sex
- History of learning disorder
- ADD
- Migraines
- Mood disorders
  - Depression
  - Anxiety
Symptoms

• Physical
  – Headache
  – Dizziness
  – Nausea/vomiting
  – Changes in sleep latency

• Cognitive
  – Feeling “foggy”, slowed down
  – Difficulty concentrating
  – Amnesia

• Emotional
Incidence

• Recent increase in incidence of concussions
  – Increased awareness and reporting
  – Decrease in young athlete fitness
• 1.6-3.8 million annually
  – 5-9% of all sports-related injuries
• Football, wrestling, soccer (both sexes), girls’ basketball
Reporting

• AAN 2013:
  – 919 athletes at UPenn were emailed survey, 262 responded
  – 43% with history of concussion had knowingly hidden symptoms to return to play
  – 22% overall would be unlikely or very unlikely to report symptoms to a coach or athletic trainer
  • Athletes with a prior history of concussion and male athletes were more likely to choose survey responses of “unlikely” or “extremely unlikely” for the future reporting questions
Preseason Evaluation

• As part of preseason physical:
  – Concussion history
  – Sport and position played
  – Baseline SCAT3 or other sideline evaluation test
Sideline Evaluation

- ABCs
- Stabilize cervical spine
- Rule out a severe TBI/need for emergent imaging
  - Focal neurologic signs
  - Deteriorating mental status
Sideline Evaluation

• Zurich Guidelines (2012):
  – Player should be evaluated by physician/LHCP
  – Assessment of concussive injury with SCAT3 or other sideline tool
  – Do not leave player alone following injury
  – Serial monitoring over initial post-injury period
  – A player with a diagnosed concussion should not be allowed to return to play on the day of the injury
Sideline Evaluation

• Once the athlete has been diagnosed with a concussion, the medical provider should:
  – Arrange follow up with the parent or guardian
  – Give take home information including:
    • Warning signs and symptoms, including signs that should prompt an ER trip
    • Avoiding cognitive and physical exertion
    • Avoiding NSAIDs
# Glasgow coma scale (GCS)

<table>
<thead>
<tr>
<th>Best eye response (E)</th>

</tbody>
</table>

GCS should be recorded for all athletes in case of subsequent deterioration.
Maddocks Score

“I am going to ask you a few questions, please listen carefully and give your best effort.”

Modified Maddocks questions (1 point for each correct answer):

<table>
<thead>
<tr>
<th>Question</th>
<th>Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>What venue are we at today?</td>
<td></td>
</tr>
<tr>
<td>Which half is it now?</td>
<td></td>
</tr>
<tr>
<td>Who scored last in this match?</td>
<td></td>
</tr>
<tr>
<td>What team did you play last week/game?</td>
<td></td>
</tr>
<tr>
<td>Did your team win the last game?</td>
<td></td>
</tr>
</tbody>
</table>

Maddocks score 0 1

Maddocks score is validated for sideline diagnosis of concussion only and is not used for serial testing.
SCAT³

SCAT³ to be done in resting state. Best done 10 or more minutes post exercise.

**SYMPTOM EVALUATION**

### How do you feel?
*You should score yourself on the following symptoms, based on how you feel now.*

<table>
<thead>
<tr>
<th>Symptom</th>
<th>none</th>
<th>mild</th>
<th>moderate</th>
<th>severe</th>
</tr>
</thead>
<tbody>
<tr>
<td>Headache</td>

</tbody>
</table>

**Total number of symptoms** (Maximum possible 22)

**Symptom severity score** (Maximum possible 132)

Do the symptoms get worse with physical activity? [Y] [N]
Do the symptoms get worse with mental activity? [Y] [N]

- self rated
- self rated and clinician monitored
- clinician interview
- self rated with parent input

**Overall rating:** If you know the athlete well prior to the injury, how different is the athlete acting compared to his/her usual self?

Please circle one response:
- no different
- very different
- unsure
- N/A
# Cognitive Assessment

**Standardized Assessment of Concussion (SAC)**

**Orientation** (1 point for each correct answer)
- What month is it? 0 1
- What is the date today? 0 1
- What is the day of the week? 0 1
- What year is it? 0 1
- What time is it right now? (within 1 hour) 0 1

**Orientation score**: 0 1 of 5

**Immediate memory**

**Total of 4**: 0 1 of 15

**Concentration: Month in Reverse Order** (1 pt. for entire sequence correct)

| Dec-Nov-Oct-Sept-Aug-Jul-Jun-May-Apr-Mar-Feb-Jan | 0 1 |

**Concentration score**: 0 1 of 5
### Neck Examination

Range of motion  
Tenderness  
Upper and lower limb sensation & strength  

Findings:  

---

### Balance examination

Do one or both of the following tests.  
Footwear (shoes, barefoot, braces, tape, etc.)

**Modified Balance Error Scoring System (BESS) testing**
Which foot was tested (i.e. which is the non-dominant foot)  
Testing surface (hard floor, field, etc.)

**Condition**
- Double leg stance:  
- Single leg stance (non-dominant foot):  
- Tandem stance (non-dominant foot at back):  

**And / Or**
- Tandem gait

Time (best of 4 trials):  

**Errors**

---

### Coordination examination

Upper limb coordination  
Which arm was tested:  
Coordination score  

Left  
Right  

of 1
Delayed Recall
The delayed recall should be performed after completion of the Balance and Coordination Examination.

“Do you remember that list of words I read a few times earlier? Tell me as many words from the list as you can remember in any order.”
Score 1 pt. for each correct response
Office Evaluation

- Comprehensive history
- Detailed neurologic exam
- Change in clinical status
  - May involve seeking additional information from coaches, athletic trainers
- Determination of need for emergent neuroimaging
The Role of Imaging in Concussion

- Usually normal in concussion
- Should only be utilized when suspecting a more serious neurologic condition
  - Intracranial bleed
- CT is the test of choice to evaluate for cranial hemorrhage, skull fracture
Neuropsychological Testing

• Zurich Guidelines:
  – Application of neuropsychological testing is of clinical value, contributes significant information in concussion evaluation
  – Should be performed when athlete is asymptomatic, but there are situations when early performance is useful
    • Return to school in pediatric athletes
  – May be used to assist RTP decisions
  – Baseline NP testing currently does not have enough evidence to recommend widespread use
Concussion Management

• Physical and cognitive rest
  – 24-48 hours following the acute injury pt should avoid any kind of stimulation
• Graded program of exertion before full return to play
• Graded return to learning
Symptom Management

• Headache
  – Acetaminophen
  – Dim quiet environment with physical modalities
  – If headache persists past 3-4 days, abortive treatment aimed at specific headache type (cluster, migraine, etc)

• Sleep Disturbance
  – Good sleep hygiene
  – No role for sleep-promoting agent or stimulant
Symptom Management

• Mood Alteration
  – Depression is most common
  – If mood issues persist >6-12 weeks, treatment with medication and/or cognitive therapy should be considered

• Cognitive Symptoms
  – Decreasing academic responsibilities, other cognitive demands

• Balance/Vertigo
  – Careful evaluation prior to treatment
  – Meclizine, diazepam for acute attacks
## Return to Play Guidelines

**Table 1. Graduated Return to Play Protocol**

<table>
<thead>
<tr>
<th>Rehabilitation stage</th>
<th>Functional exercise at each stage of rehabilitation</th>
<th>Objective of each stage</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. No activity</td>
<td>Symptom-limited physical and cognitive rest.</td>
<td>Recovery</td>
</tr>
<tr>
<td>2. Light aerobic exercise</td>
<td>Walking, swimming, or stationary cycling keeping intensity &lt; 70% maximum permitted heart rate. No resistance training.</td>
<td>Increase heart rate</td>
</tr>
<tr>
<td>3. Sport-specific exercise</td>
<td>Skating drills in ice hockey, running drills in soccer. No head impact activities.</td>
<td>Add movement</td>
</tr>
<tr>
<td>4. Non-contact training drills</td>
<td>Progression to more complex training drills eg, passing drills in football and ice hockey. May start progressive resistance training)</td>
<td>Exercise, coordination, and cognitive load</td>
</tr>
<tr>
<td>5. Full contact practice</td>
<td>Following medical clearance participate in normal training activities</td>
<td>Restore confidence and assess functional skills by coaching staff</td>
</tr>
<tr>
<td>6. Return to play</td>
<td>Normal game play</td>
<td></td>
</tr>
</tbody>
</table>
Return to Play Guidelines

• Each step of the protocol should take approximately 24 hours
• If athlete experiences symptoms → 24 hour rest period and return to previous asymptomatic stage
• Athletes should be symptom and medication free before returning to play
Return to Learning Guidelines

• Pediatrics: 10/27/2013
• Goal during concussion: avoid overexerting the brain to the level of worsening or reproducing symptoms
  – Increasing evidence that using the concussed brain to learn may worsen symptoms and prolong recovery
  – Recovery for school age students occurs within 3 weeks from injury
• Overall goal: minimal disruptions to student’s life and return to school as early as possible
Return to Learning Guidelines

- Students benefit from multi-disciplinary team to maximize recovery

**TABLE 2 Multidisciplinary Team to Facilitate “Return to Learning”**

<table>
<thead>
<tr>
<th>Team</th>
<th>Members of the Team</th>
</tr>
</thead>
<tbody>
<tr>
<td>Family team</td>
<td>Student, parents, guardians, grandparents, peers, teammates, and family friends</td>
</tr>
<tr>
<td>Medical team</td>
<td>Emergency department, primary care provider, concussion specialist</td>
</tr>
<tr>
<td></td>
<td>(primary care sports medicine physicians, neurologists, neurosurgeons, as examples)</td>
</tr>
<tr>
<td></td>
<td>clinical psychologist, neuropsychologist, team and/or school physician</td>
</tr>
<tr>
<td>School academic team</td>
<td>Teacher, school counselor, school psychologist, social worker, school nurse, school administrator, school physician</td>
</tr>
<tr>
<td>School physical activity team</td>
<td>School nurse, athletic trainer, coach, physical education teacher, playground supervisor, school physician</td>
</tr>
</tbody>
</table>

All members listed for a team do not need to be involved for successful concussion management. An individual, such as an emergency department physician, may only be involved in the initial assessment and suggestion for initiating academic adjustments. Some members may serve roles on various teams. Some schools may have access to only certain individuals suggested for a team. This list is meant to serve as a framework to help pediatricians and others involved with concussion management, possible roles they can serve for a student with a concussion.
Return to Learning Guidelines

• Student is encouraged to return to school when they can tolerate 30-45 minutes of cognitive stimulation

• Observe which classes exacerbate symptoms and then adjust schedule accordingly
  – Replace with study hall
  – Shorter school day

• Academic team should reassess adjustments weekly for effectiveness and necessity
### TABLE 4 Signs and Symptoms of a Concussion and the Strategies to Help in the School Setting

<table>
<thead>
<tr>
<th>Sign/Symptom</th>
<th>Potential Adjustments in School Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequent breaks</td>
<td>Allow student to put head down if symptoms worsen</td>
</tr>
<tr>
<td>Identifying aggravators and reducing exposure to them</td>
<td>Give student early dismissal from class and extra time to get from class to class to avoid crowded hallways</td>
</tr>
<tr>
<td>Rests, planned or as needed, in nurses office or quiet area</td>
<td>Reduce exposure to computers, smart boards, videos</td>
</tr>
<tr>
<td>Allow student to put head down if symptoms worsen</td>
<td>Reduce brightness on the screens</td>
</tr>
<tr>
<td>Dizziness</td>
<td>Allow the student to wear a hat or sunglasses in school</td>
</tr>
<tr>
<td>Reduce brightness on the screens</td>
<td>Consider use of audiotapes of books</td>
</tr>
<tr>
<td>Give student early dismissal from class and extra time to get from class to class to avoid crowded hallways</td>
<td>Turn off fluorescent lights as needed</td>
</tr>
<tr>
<td>Visual symptoms: light sensitivity, double vision, blurry vision</td>
<td>Seat student closer to the center of classroom activities (blurry vision)</td>
</tr>
<tr>
<td>Reduce exposure to computers, smart boards, videos</td>
<td>Cover 1 eye with patch/tape 1 lens if glasses are worn (double vision)</td>
</tr>
<tr>
<td>Noise sensitivity</td>
<td>Allow the student to have lunch in quiet area with a classmate</td>
</tr>
<tr>
<td>Limit or avoid band, choir, or shop classes</td>
<td>Avoid noisy gyms and organized sports practices/games</td>
</tr>
<tr>
<td>Avoid noisy gyms and organized sports practices/games</td>
<td>Consideration of the use of earplugs</td>
</tr>
<tr>
<td>Consideration of the use of earplugs</td>
<td>Give student early dismissal from class and extra time to get from class to class to avoid crowded hallways during pass time</td>
</tr>
<tr>
<td>Difficulty concentrating or remembering</td>
<td>Avoid testing or completion of major projects during recovery when possible</td>
</tr>
<tr>
<td>Provide extra time to complete nonstandardized tests</td>
<td>Postpone standardized testing (may require that 504 plan is in place)</td>
</tr>
<tr>
<td>Postpone standardized testing (may require that 504 plan is in place)</td>
<td>Consider 1 test per day during exam periods</td>
</tr>
<tr>
<td>Consider 1 test per day during exam periods</td>
<td>Consider the use of preprinted notes, notetaker, scribe, or reader for oral test taking</td>
</tr>
<tr>
<td>Sleep disturbances</td>
<td>Allow for late start or shortened school day to catch up on sleep</td>
</tr>
<tr>
<td>Allow rest breaks</td>
<td></td>
</tr>
</tbody>
</table>
Maryland School Policy

• All coaches are required to be trained in, provide written verification of concussion awareness training
  – CDC, National Federation of State High School Association or the Oregon Center for Applied Science ACTive course

• Provide athletes and parents written information about the nature and risks of concussions
  – Parents and athletes must provide written verification of receiving information
Maryland School Policy

• Schools shall make academic accommodations for student-athletes with concussions
• Non-school youth athletic activities conducted on school property must assure that parents and participants are given concussion information
• Concussion resources available at every practice/competition where an athlete may sustain a concussion
Maryland School Policy

• Delineates between collision, contact, limited contact and no contact sports

• Collision and contact sports have practice restrictions, require coaches to teach proper contact techniques specialized by sport
  – Football: proper body-to-body contact, tackling techniques
  – Boys’ Lacrosse: proper body checking techniques

More information can be found at http://www.mpssaa.org/HealthandSafety/Concussions.asp
Prolonged Concussive Symptoms

- Lasts weeks to months beyond initial injury
- Any symptom or constellation of symptoms can be involved
- Many potential, no proven causes
- Risk factors:
  - Increasing age
  - Female
  - Non-sports related concussion
Prolonged Concussion Symptoms

• Foundation of management: time
• Management by a team of providers, ideally who work with concussion frequently
• Cognitive therapy, integrated neurorehabilitation programs, supervised progressive exercise programs may improve recovery
Summary

- Concussion: mild TBI that may present with any number of symptoms, the most common including headache, dizziness, and balance disturbance
  - LOC is not a requirement for concussion diagnosis
- Biggest risk for getting a concussion is a previous history of concussions
- Recognition and initial assessment of concussion should be guided by a symptoms checklist, cognitive evaluation, balance tests and neurological physical exam
Summary

• Sideline evaluation with SCAT3 or other standardized symptom checklist
• Physical and cognitive rest are the cornerstone of management
• Usual resolution of symptoms is within 7-10 days
• Return to play should be guided by a specific protocol with 6 stages taking 24 hours each
• Return to learning should be individualized based on patient’s symptoms
